Compile Metadata for LGC Samples

We need to build a file of metadata for the sample set. This will be added to as we complete various steps in the analysis - filtering (# of SNPs genotyped), sample sexing (genotype sex, final sex), recapture analysis (clone ID), etc.

Input data needed

We need a couple of pieces of information before we can compile the metadata for the samples.

1. `Finalized Hair Samples w Metadata_Carr.xlsx` - contains information on the locations (hair snares), weeks, and years where samples were collected along with sample IDs (both the UGA ID and the Rapid Genomics ID (plate and well)) - saved as a `csv file`.
2. `UGA_173101_Summary_Sheet.csv` - includes information on the final Rapid Genomics ID (plate and well when sequenced), the name of the corresponding fastq file, and the original customer code (UGA ID above). Use this to match `rgID` to `ugaID`.

Overview of metadata file

The file we build will have the following columns…

1. `rgID` - the RapidGenomics ID from data delivery summary sheet
2. `ugaID` - Random UGA ID (a.k.a. Customer_Code from data delivery summary sheet)
3. `is.SCR` - is this sample a sample to be used in SCR?
4. `is.rep` - is this sample replicated?
5. `week` - Week (occasion) of sampling (for SCR samples)

6. `year` - Year of sampling (for SCR and non-SCR samples)
7. `snare` - snare ID (for SCR samples) from name23 or name24
8. `utmSnare` - UTM id - unique for all locations
9. `fqfile` - The fastq file for this sample
10. `knownSEX` - known sex, where available
11. `sampSOURCE` - source of the sample (hair snare, etc.)
12. `region` - region (population) where the sample was collected

Compile Metadata

```
smsht <- read.csv("../input/UGA_173101_Summary_Sheet.csv", header = TRUE)
sampinfo <- read.csv("../input/Finalized Hair Samples w Metadata_Carr.csv", header = TRUE)
translatable <- read.csv("translatable.csv", header = TRUE)
head(translatable)
```

We should be able to use that file to fill in the capture history by matching dimnames of `y.all[i,j,k,t]` to the recaptured individual, `utmSnare`, week, and year (respectively).

Check the sample numbers processed to date

Some summaries of number of samples by region, year, week, snare, etc…
